

Low Code Mobile Apps Development

For this course, we will be using OutSystems platform to dabble into creation of mobile apps.

Prerequisite for this course:

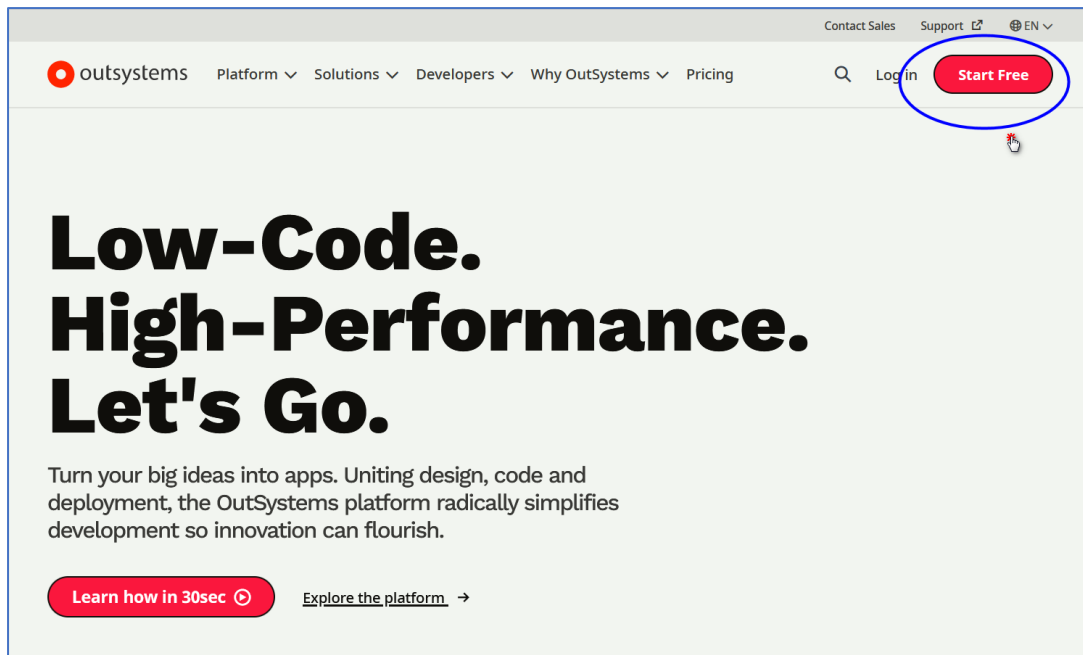

- i) Working laptop with Windows environment (provided in the training lab)
- ii) OutSystems account

Account registration is free of cost. However, it may be good to have it ready by the time we start the course. Development using OutSystems requires constant Internet connectivity and the necessary whitelisting of sites may be needed.

Account Registration

Step 1

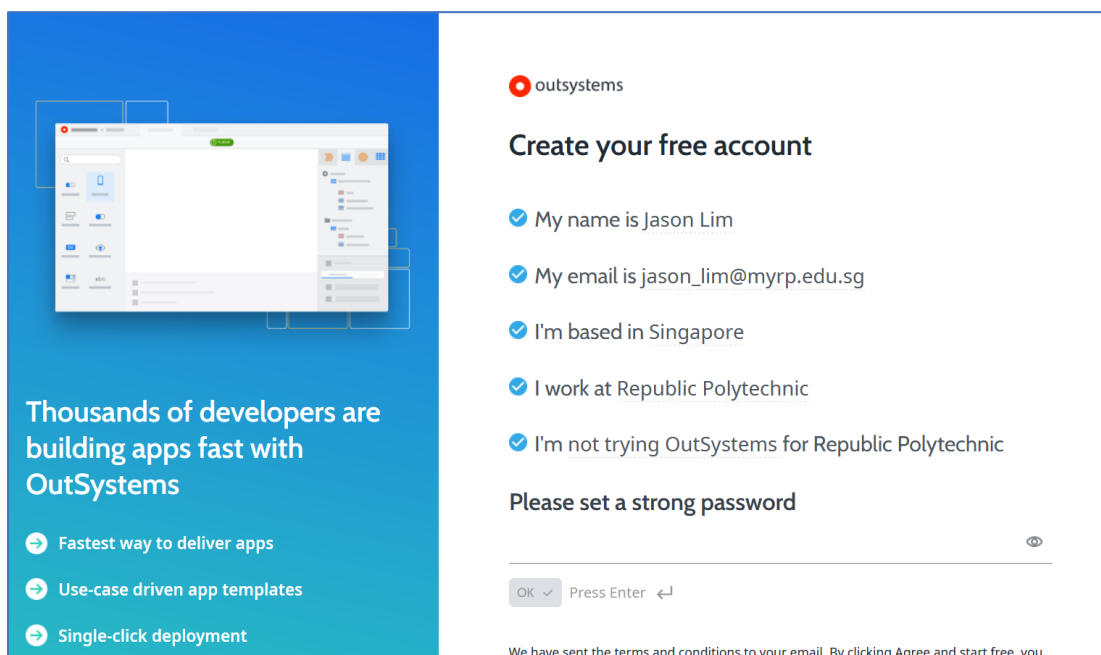

Navigate to www.outsystems.com using any preferred browser.

Step 2

OutSystems will require some details like name, email, etc. Do proceed with entering the necessary details to continue.

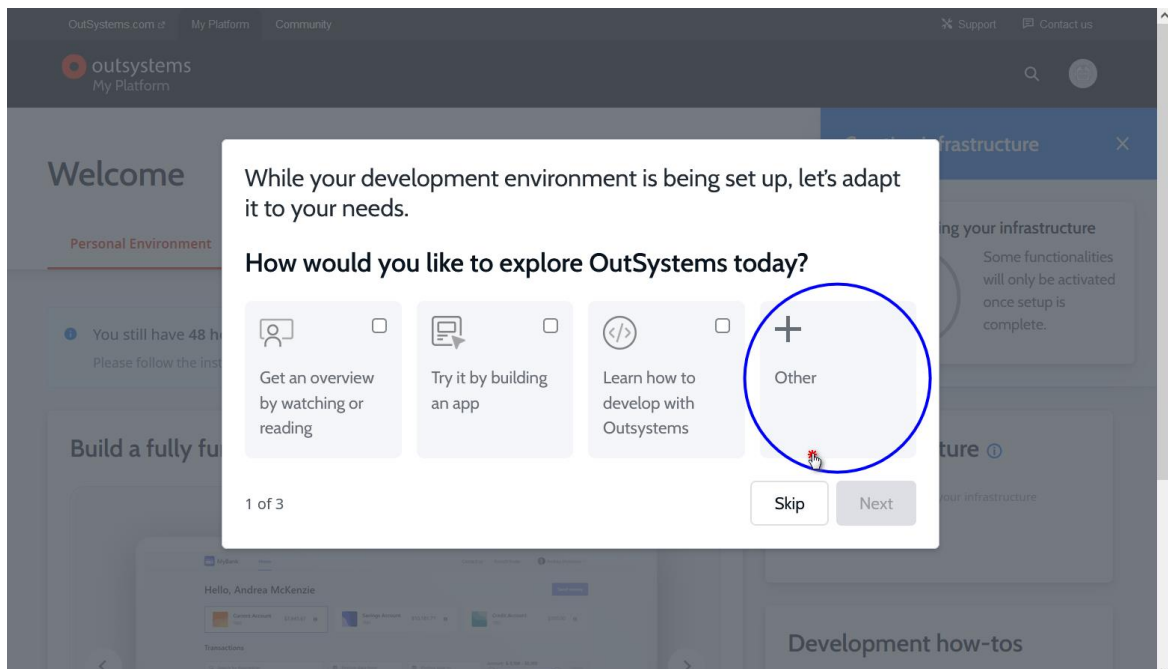

The screen below will be shown after some information has been entered.

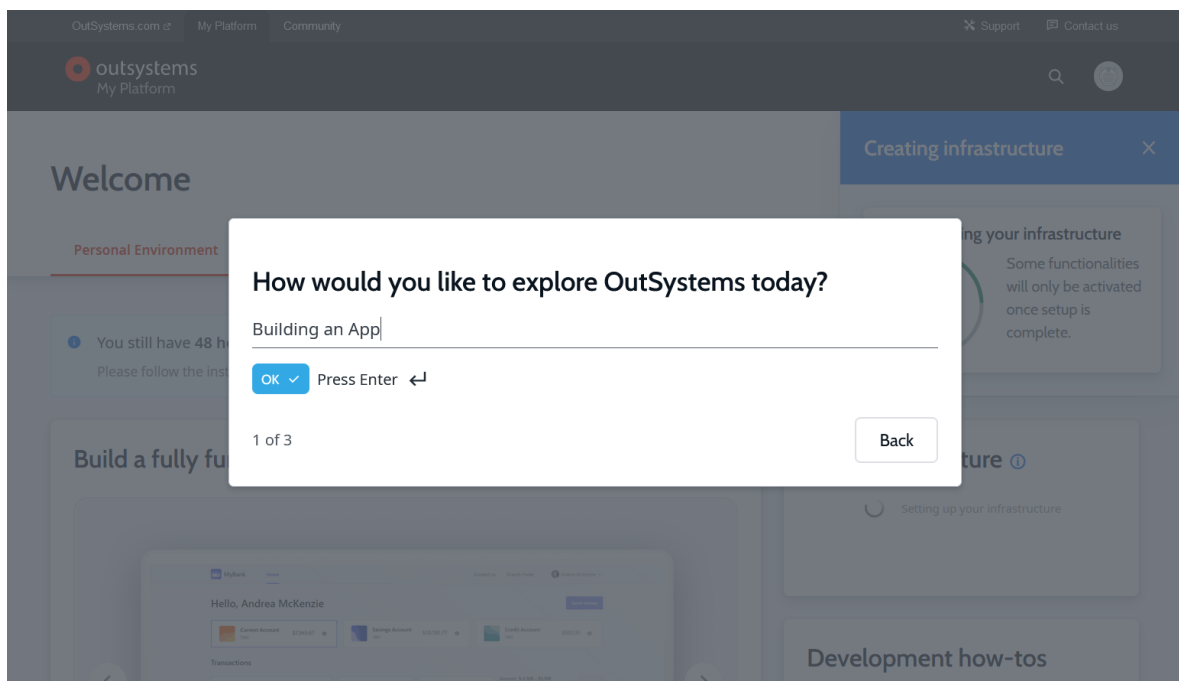

Step 3

Continue with the Registration Wizard by clicking on “Other”.

The other options can be visited later on. For now, we just want the environment to be set up.

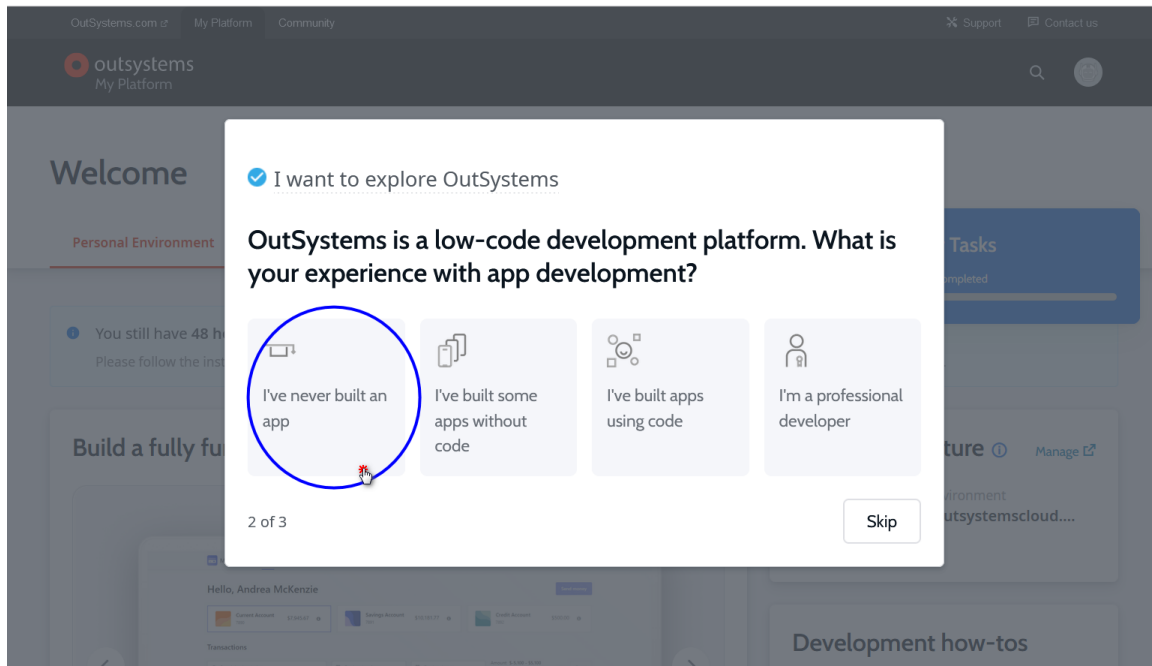

The next screen will be displayed. You could enter “Building an App” or something along that line, as shown below.

Step 4

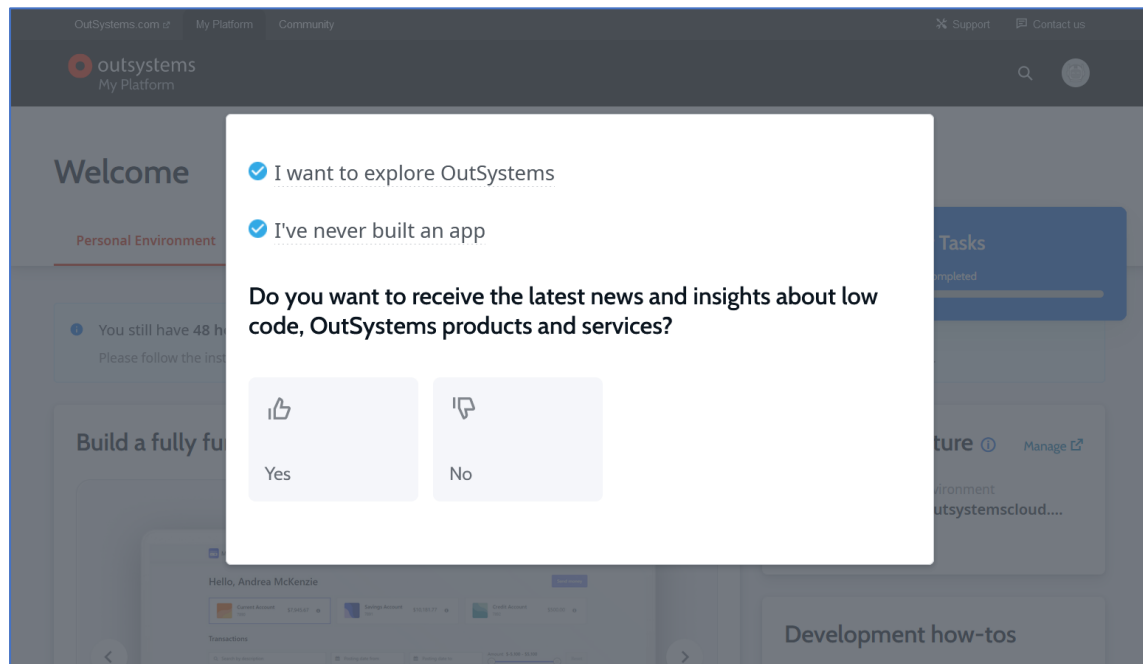

The next screen probably determines the level of hints and help to be displayed.

You could select the appropriate level according to your prior experience in apps development.

Step 5

This is definitely up to you 😊

Step 6

If you like to install the Service Studio (which is the software tool to build the app) on your current machine, you can choose to download it.

In this case, we only need the account to be set up. Since the training lab already has the software tool installed on laptops, we will skip this.
